ı

All work in UNSW Animal facilities and UNSW Physical Containment facilities must follow the Australian Standard AS/NZS 2243 series for minimum best practice as well as any legislated requirements.

The risk of exposure to tetanus for workers in an animal facility, working with all types of animals, must be considered in any risk assessment.

Certain types of wounds are likely to favour the growth of tetanus organisms. These wounds may be the result of an animal bite or scratch, but could also be pre-existing, non-work related, wounds, and could include:

compound fractures;

bites, scratches, or deep penetrating wounds, (See Appendix 2) wounds containing foreign bodies (especially wood splinters) wounds complicated by purulent (pus-containing) infections wounds with extensive tissue damage (e.g., contusions or burns); or any superficial wound obviously contaminated with soil, dust, or manure (especially horse manure)

wounds where topical disinfection is delayed more than 4 hours.

In previously vaccinated people, the administration of more than 1 dose of a tetanus-containing vaccine in a 5-year period may provoke adverse events. Adults who have sustained injuries deemed to be tetanus-prone should receive a tetanus booster dose if more than 5 years have elapsed since the last dose.

Hazard Type/ Risk of Injury or Illness

i. Allergens

Particularly animal proteins, urine, and serum Hair/fur/dander Mould spores Dust (e.g., feed, wood products/bedding) Latex particles/gloves (talc) Mites in animal feed

Laboratory Animal Allergy (LAA)

Prevalence: - 7 to 44% of people exposed to laboratory animals, especially rats Smoking and history of allergies may increase prevalence of atopic/allergic disease Allergic rhinitis (hay-fever) accounts for 90% of all symptoms associated with LAA Allergic reaction of lower respiratory tract (e.g., asthma symptoms, coughing, shortness of breath) Allergic dermatitis or contact urticaria (e.g.,

itchy rash, hives)

i. Hazardous manual tasks

Lifting, carrying, pushing, pulling and related activities

Handling of animals, goods (e.g., feed and bedding) and equipment such as compressed gas cylinders

Possible Risk Controls

Increasing ventilation can reduce allergen exposure four-fold

Air filtering

Screen food supplies for mites

High quality/low dust bedding and feed documented

Physical barriers to reduce exposure

Safe Work Procedures (SWPs)

Training/awareness

Pre-employment medical

Smoking reduction program

Annual monitoring for early detection of

Laboratory Animal Allergy (LAA) - lung function tests, and possible blood antibody testing

Personal Protective Clothing and Equipment (PPE) - gloves/gowns/ P2 mask for routine work higher risk activities

Glove allergies reduce use of latex or use non-latex gloves, use non-powdered gloves, use cotton liner

Good housekeeping

Modify object, size, weight if possible (eg order in smaller animals or smaller bags of feed/bedding)

Mechanically restrain large animals Modify actions, movements

Risk factors: - posture, design of workstation and activity, size/weight of object, animate or inanimate, height, position, duration, frequency, etc.

Risk of muscular stress especially back,

Hazard and incident reporting, investigation, and corrective action response

The most significant hazards to mother and unborn child are:

Physical changes associated with late pregnancy make the pregnant woman more susceptible to injury from hazardous manual tasks.

The key zoonotic disease during pregnancy is toxoplasmosis (e.g., from cats) however protozonal diseases may also be a risk for pregnant or immunocompromised people. Listeriosis (from certain types of food) is a significant risk during pregnancy. Intrauterine infection may lead to congenital abnormality or death of the foetus. Fastidious personal hygiene is required to minimise risk of infection. Medical advice should be sought before receiving any vaccination.

Refer also to the WHS Act 2011 Part 3, Section 35, and WHS Regulations 2017 Part 11.3, Clause 699 for the full description of Incident Notification requirements

Department of Agriculture:

Assorted cryptosporidia

Pasteurella

Bites e.g. rat bite fevers, mixed aerobic/anaerobic infections

Hydatidosis

Ringworm

Leptospirosis (Weil's disease)

Toxocara canis Ascarid allergy

Rabies (if travelling overseas)

Mites, assorted

Hendra virus Lyssa virus

In some countries may be a reservoir for Ebola

Herpes virus simiae (B virus)

Hepatitis A, B, C, D, E

HIV Yaba virus

Cytomegalovirus Poliomyelitis virus

Tuberculosis (M. tuberculosis)

Shigella Salmonella Giardia

Balantidium coli

Entamoeba histolytica

Sarcoptes

Irrespective of where the animal was sourced, any bite or scratch from an animal needs immediate attention. Rat bites in particular need closer attention.

Refer to paragraph 5.2 for the requirements for reporting such incidents.
